

DV RETAIL STORE INVENTORY MANAGEMENT SYSTEM CLIENT TRAINING GUIDE

Project Type: Software Implementation Simulation

Role: Implementation Specialist / Data Analyst

Prepared by: Your Name

Date: September 2026

Portfolio Simulation: DV Retail Store is a fictional client created for portfolio demonstration purposes.

1. Training Objectives

The purpose of this training is to help DV Retail Store users understand how to use the implemented inventory management and reporting solution.

After the training, users should be able to:

- Understand the purpose of the inventory system.
- View product and inventory information.
- Monitor current stock levels.
- Identify low-stock products.
- Review sales information.
- Understand the dashboard KPIs.
- Use the Power BI dashboard for basic reporting.
- Perform basic troubleshooting and know when to request support.

2. Training Audience

This training is intended for:

- Store or inventory staff
- Sales staff
- Store management
- Users responsible for monitoring inventory and sales reports

3. System Overview

The DV Retail Store Inventory Management System is designed to help users monitor products, inventory levels, sales, and low-stock items.

The solution consists of:

- **Product Data** — Contains product names, categories, suppliers, prices, and reorder levels.
- **Inventory Data** — Contains current stock quantities and last update dates.
- **Sales Data** — Contains sales transactions, quantities sold, dates, and prices.
- **Power BI Dashboard** — Provides visual reports and key performance indicators (KPIs).

Main Activities

Users can use the solution to:

1. View available products.
2. Check current inventory levels.
3. Identify products that need replenishment.
4. Review sales performance.
5. Monitor total inventory value.
6. Review summarized information through the Power BI dashboard.

4. Using the Power BI Dashboard

The Power BI dashboard provides a visual summary of inventory and sales information.

4.1 Dashboard KPIs

Users should understand the following KPIs:

KPI	Meaning
Total Sales	Total recorded sales based on quantity sold $\times$ unit price
Total Inventory Value	Estimated value of current inventory based on stock quantity $\times$ unit price
Low Stock Items	Number of products at or below their reorder level
Total Products	Number of products recorded in the system

Current Dashboard Values

- **Total Sales:** ₱4,925
- **Total Inventory Value:** ₱20,905
- **Low Stock Items:** 4
- **Total Products:** 10

4.2 Sales by Category

The **Sales by Category** visual allows users to compare sales across product categories.

Users can use this visual to identify which product categories have recorded higher or lower sales.

4.3 Sales by Product

The **Sales by Product** visual shows the total sales generated by each individual product.

Users can use this information to review product-level sales performance.

4.4 Current Inventory by Category

The **Current Inventory by Category** visual shows the quantity of products currently available, grouped by category.

4.5 Low Stock Products

The **Low Stock Products** table identifies products whose current stock is at or below their defined reorder level.

Users can use this section to identify products that may require replenishment.

5. Monitoring Inventory

Users can monitor current inventory levels through the inventory data and Power BI dashboard.

5.1 Inventory Information

Each inventory record contains:

- **Inventory ID** — Unique identifier for the inventory record.
- **Product ID** — Identifies the related product.
- **Stock Quantity** — Current quantity available.
- **Last Updated** — Date when the inventory information was last updated.

5.2 Checking Stock Levels

Users should regularly review the **Current Inventory by Category** visual and the **Low Stock Products** table.

When a product reaches or falls below its reorder level, it is identified as **Low Stock**.

Example

If a product has:

Stock Quantity: 8

Reorder Level: 15

The product is classified as:

Low Stock

Users should report or review these products for possible replenishment according to the store's normal inventory process.

5.3 Maintaining Inventory Data

When inventory information changes, users should ensure that:

1. The correct Product ID is used.
2. The Stock Quantity is accurate.
3. The Last Updated date is updated.
4. The Power BI report is refreshed after the source data has been updated.

6. Identifying Low-Stock Products

The system identifies products as **Low Stock** when the current stock quantity is less than or equal to the product's reorder level.

Condition:

Stock Quantity $\leq$ Reorder Level

Current Low-Stock Products

Product	Stock Quantity	Reorder Level
Coffee 250g	8	15
Shampoo 250ml	5	10
Wireless Mouse	3	5
Mineral Water 1L	10	15

Recommended User Action

When a product appears in the Low Stock Products table, the user should:

1. Review the current stock quantity.
2. Check the product's reorder level.
3. Inform the appropriate inventory or store personnel.
4. Follow the store's normal replenishment process.

Note: The system identifies low-stock items; the actual purchasing or replenishment decision remains with the business.

7. Reviewing Sales Information

Users can review sales information through the Power BI dashboard.

7.1 Sales by Product

The **Sales by Product** visual shows the total sales generated by each product.

Users can use this information to:

- Review product-level sales.
- Compare sales between products.
- Identify products with recorded sales activity.

7.2 Sales by Category

The **Sales by Category** visual groups sales according to product category.

The current recorded sales by category are:

Category	Total Sales
Grocery	₱2,210
Electronics	₱1,380
Stationery	₱750
Personal Care	₱375
Beverage	₱210
Total	₱4,925

7.3 Checking Total Sales

The **Total Sales** KPI summarizes the recorded sales transactions.

The current total recorded sales are:

₱4,925

Users should verify that the underlying sales data contains the correct:

- Product ID
- Sale Date
- Quantity Sold
- Unit Price

8. Basic Troubleshooting

Users can use the following steps when they encounter common issues.

Issue	Possible Action
Dashboard information is not updated	Refresh the Power BI report and verify the source data.
Product is missing	Check whether the product exists in the Products data and verify the Product ID.
Inventory quantity appears incorrect	Verify the Product ID, Stock Quantity, and Last Updated fields.
Product is not appearing as Low Stock	Compare the Stock Quantity with the product's Reorder Level.
Sales total appears incorrect	Verify Quantity Sold and Unit Price in the Sales data, then refresh the report.
Dashboard visual is not displaying correctly	Refresh the report and check whether the required source data is available.

When to Request Support

Users should request assistance when:

- Data cannot be corrected using the normal process.
- A dashboard error continues after refreshing.
- A product or transaction cannot be found.
- There is an unexpected difference between the source data and dashboard.
- Database or report configuration changes are required.

9. Training Completion

At the end of the training session, users should be able to demonstrate that they understand the basic functions of the inventory solution.

User Checklist

The user should be able to:

- ☐ Locate the inventory management dashboard.
- ☐ Understand the dashboard KPIs.
- ☐ Review current inventory quantities.
- ☐ Identify low-stock products.
- ☐ Review sales by product.
- ☐ Review sales by category.
- ☐ Understand the total inventory value.
- ☐ Perform a basic dashboard refresh.
- ☐ Identify when support is required.

Training Outcome

The training provides users with the basic knowledge required to navigate and interpret the inventory management solution and use the dashboard for day-to-day inventory and sales monitoring.

10. Support and Maintenance

For continued use of the solution, users should:

1. Keep product information accurate.
2. Keep inventory quantities updated.
3. Record sales transactions accurately.
4. Review low-stock items regularly.
5. Refresh the Power BI report after source data changes.
6. Report data or system issues to the appropriate support person.

11. Training Summary

The client training covered the basic use of the DV Retail Store Inventory Management System and Power BI dashboard.

The training covered:

- System purpose and main functions
- Product and inventory information
- Inventory monitoring
- Low-stock identification
- Sales monitoring
- Dashboard KPI interpretation
- Basic troubleshooting
- Support and maintenance procedures

Expected User Outcome

After completing the training, users should be able to independently perform basic inventory and sales monitoring tasks and understand when additional support is required.

12. Portfolio Disclaimer

This project is a fictional implementation simulation created for portfolio demonstration purposes.

DV Retail Store is not an actual client. The project demonstrates practical skills in requirements gathering, data preparation, software configuration, SQL, Power BI reporting, user training, documentation, testing, and implementation support.
